

ProtoNet 5-way 5-shot Episode Evaluation

Each episode: 1 N-way K-shot + Q-query task (N = 5, K = 5 in this example)

Evaluation protocol

- 5-way 5-shot
- Each episode: 1 N-way K-shot + Q-query task
- Total 600 episodes, report average accuracy

Evaluation metric

- Episode accuracy =
(number of correctly classified queries) /
(total number of queries)

Key idea

- Use the frozen encoder's representations
- Classify by distance to class prototypes
- No encoder fine-tuning: only a few labeled samples are needed to evaluate new classes
